PROJECT DEVELOPMENT PHASE

SPRINT-II

Date	27 August 2022
	PNT2022TMID38828
Team ID	
Project Name	Natural Disaster Intensity Analysis and Classification
	using Artificial Intelligence

INSERTING NECESSARY LIBRARIES:

Numpy: It is an open-source numerical python library. **Scikit-learn:** It is a machine learning library for python.

OpenCV: OpenCV is a library of programming functions mainly aimed at real-

time computer vision.

Flask: Web framework used for building web application.

LOADING DATA AND PERFORMING DATA AUGUMENTATION:

Loading the data into the Jupyter notebook by using RR dataset path.

```
Apply ImageDataGenerator Functionality To Trainset And Testset

Performing data augmentation to train data
x_train = train_datagen.flow_from_directory('/content/dataset/train_set', target_size = (64,64), batch_size = 5, color_mode = 'rgb', class_mode = 'categorical')
performing data augmentation to test data
x_test = test_datagen.flow_from_directory('/content/dataset/tost_set', target_size = (64,64), batch_size = 5, color_mode = 'rgb', class_mode = 'categorical')

Found 742 images belonging to 4 classes.

Found 198 images belonging to 4 classes.

[21] print(x_train.class_indices)
['Cyclone': 0, 'Earthquake': 1, 'Flood': 2, 'Wildfire': 3)

[24] from collections import Counter as c
c(x_train_.labels)

Counter((0: 220, 1: 156, 2: 198, 3: 168))
```

CREATING THE MODEL:

Creating the Model a Classifier Sequential. Classifier is a machine learning algorithm that determines the class of the input element based on the set of the feature. In this model using convolution2D function. Convolution2D parameter is a number of filters that convolution layer will be learn from. Then we will be using MaxPooling2D function. Then, using a Flatten () function that flatten the multidimensional input denser into the denser.

```
model = Sequential()

# First convolution layer and pooling
model.add(Conv2O(32,(3,3)),input_shape=(64,64,3),activation='relu'))
model.add(Conv2O(32,(3,3)),activation='relu'))
```

Using classifier. Summary () function summary of our model

model.summary()			
Model: "sequential"			
Layer (type)	Output Shape	Param #	
conv2d (Conv2D)	(None, 62, 62, 32)	896	
max_pooling2d (MaxPooling2D)	(None, 31, 31, 32)		
conv2d_1 (Conv2D)	(None, 29, 29, 32)	9248	
max_pooling2d_1 (MaxPooling 2D)	(None, 14, 14, 32)		
flatten (Flatten)	(None, 6272)		
dense (Dense)	(None, 128)	802944	
dense_1 (Dense)	(None, 4)		
Total params: 813,604 Trainable params: 813,604			

COMPILING THE MODEL:

The model is compiled using the following code.

```
/ [13] # Compiling the model

model.compile(optimizer='adam', loss='categorical_crossentropy', metrics=['accuracy'])
```

FITTING THE MODEL:

Fitting the Model with 20 epochs.

SAVING THE MODEL:

Saving the Model as disaster.h5. disaster.h5 file is used to find the image classification files. Model.json represents that Jason stands for JavaScript object rotation, Jason is a lite weight data format used for data inserting between multiple different language.

```
model.save('disaster.h5')
model.json - model.to_json()
with open("model.bw_json", "w") as json_file:
    json_file.write(model_json)
```

PREDICTING RESULTS:

Loading model from the TensorFlow keras models and loading the image then converting image into array. Then predicting our model.
